

Audio Visual Design Group partners with Mozilla to create and refine standardized systems that are both scalable and repeatable across the organization's sites globally. This includes design, build, consulting & commissioning of rooms built both from standard templates and from flexible designs based on those templates and certain other criteria. This results in a unified user experience from office to office for all systems, including conference rooms of various sizes, training spaces, community spaces and workplace features such as digital signage and distributed audio. The templates allow for rapid design and deployment of new rooms, and for consistency in regards to service.

AVDG provides a complete turnkey audio visual program for Mozilla by performing all work in California in-house, and by partnering with reputable and talented firms in other markets to build systems designed by AVDG and Mozilla.

In addition to Design & Build work, Mozilla also takes advantage of a centralized service and support agreement with Audio Visual Design Group which allows us to provide first-line support remotely for most issues and to deploy technicians as needed with rapid response in any market."
